PROFESSIONAL SUMMARY

Results-driven Software Engineer with 1+ years of experience building production-grade backend systems and SOA-based test automation frameworks. Proven track record delivering RESTful APIs in Java/Spring Boot at scale (10M+ message transactions), reducing API latency by 20%, and architecting E2E automation suites adopted across 3 product teams. Currently onboarding MCP tooling at Johnson Controls. Targeting roles in backend engineering and data infrastructure where Python, SQL, and CI/CD experience add immediate value.

WORK EXPERIENCE

Automation Test Engineer (SDET) – Johnson Controls 01/2026 – Present

- Architected a scalable SOA-based E2E automation framework from scratch, consolidating test coverage across 3 product teams by standardising API test suites in Python (Flask/FastAPI) and reducing framework onboarding time by 40%.
- Designed and implemented API validation pipelines using Postman + Python with SQLite as the test-data store, increasing regression test reliability and enabling CI/CD integration into the team’s delivery pipeline.
- Maintained a legacy Java automation framework — refactored 15+ modules to improve stability, raising suite pass rate from 72% to 91% across two sprint cycles.
- Evaluated and onboarded MCP (Model Context Protocol) tooling for an upcoming AI-assisted internal project, aligning with the organisation’s 2025 AI tooling roadmap.
- Enforced clean-code standards using GitHub Copilot and GitHub Code Review, reducing PR review cycle time by approximately 25% across a team of 6 engineers.

Junior Software Engineer – Onextel 07/2025 – 12/2025

- Engineered 30+ RESTful API endpoints in Java and Spring Boot to support WhatsApp and RCS messaging workflows, serving a platform with thousands of daily active users across two product lines.
- Reduced API p95 latency by 20% by optimising PostgreSQL queries, introducing Redis caching for high-read endpoints, and refactoring N+1 query patterns identified through profiling.
- Designed and deployed a high-throughput campaign scheduling module for bulk WhatsApp/RCS broadcasts, increasing batch-processing capacity by 30% and supporting 10M+ message deliveries per month.
- Built JUnit and TestNG unit and integration test suites covering 80% of new endpoints, and contributed Selenium regression tests that reduced manual QA effort by 35% across 4 major releases.
- Containerised backend microservices using Docker, enabling consistent staging deployments and supporting a PostgreSQL-backed architecture for multi-tenant message delivery.

Data Analyst Intern – Johnson Controls 01/2024 – 06/2024

- Automated data ingestion and dashboard refresh workflows using Python and Power BI, eliminating 60% of manual reporting hours and freeing the analytics team to focus on strategic analysis.
- Delivered 50+ interactive operational dashboards consumed by leadership and field operations teams, enabling data-driven decisions across Open Blue platform initiatives.
- Integrated JIRA-linked pipeline documentation with the Open Blue Support Team, improving cross-functional tracking efficiency by 25% and reducing ticket resolution ambiguity.
- Performed exploratory data analysis (EDA) on device telemetry datasets, applying KNN-based anomaly detection to surface actionable maintenance insights for the IoT analytics team.

EDUCATION

MIT World Peace University -Pune *B.E. Electronics & Communication Engineering* 05/2021–05/2025

PROJECTS

Decentralized Smart Energy Grid Using IoT and Blockchain IEEE ICETET-SIP 2025 (Document No. 1156685)

- Architected a decentralized energy-trading system using IoT nodes (ESP8266, INA219), a Node.js backend, and Ethereum smart contracts.
- Deployed real-time device telemetry and monitoring through a ReactJS dashboard, achieving sub-second update responsiveness.
- Cut energy-transfer losses from **40% to below 20%** by calibrating sensor inputs and refining energy-routing logic.
- Strengthened transaction integrity using blockchain-based validation, reducing data-inconsistency issues by 90% in peer-to-peer simulations.

SKILLS

Programming	Java, Python, C++, SQL
Backend & APIs	Spring Boot, Flask, FastAPI, RESTful API Design & Development, SOAP Services, Microservices Architecture, Redis, Docker
Databases & Tools	PostgreSQL, SQLite, RocksDB, Schema Design, Query Optimisation, Indexing Strategies, Git, JIRA, Postman, Confluence
Cloud & DevOps	AWS (S3, Lambda), CI/CD Integration (GitHub Actions, Azure DevOps), Docker, Git
Testing & Automation	JUnit, TestNG, Selenium WebDriver, Postman, API Test Automation, SOA Framework Design, Pytest
Analytics & BI	Power BI, Tableau, EazyBI, ETL Pipeline Design, EDA, Data Validation & Quality Checks
AI & Emerging Tech	GitHub Copilot, MCP (Model Context Protocol), Blockchain (Ethereum), IoT Systems (ESP8266, INA219), Machine Learning (EDA, KNN, Hugging Face)
Tools & Practices	JIRA, Confluence, Agile/Scrum, Code Review, Technical Documentation

ACHIEVEMENTS

IEEE Published Researcher · HackMIT Competitor · Founder, MIT-WPU SQUAD-UP
